

STEP-BY-STEP SETUP GUIDE

Deploying chrisgantt.com

GitHub → Cloudflare Pages → Custom Domain · Estimated time: 20–30 minutes

Download your website file

You need the `index.html` file Claude built for you saved on your MacBook.

1

Find the file Claude gave you

In your Claude conversation, click the download button on the

`index.html`

file artifact. Save it somewhere easy to find — your Desktop or a new folder called

`chrisgantt-site`

in your Documents.

2

Confirm the file is saved

Open Finder on your Mac, navigate to where you saved it, and confirm you can see

`index.html`

. That's the only file your site needs right now.

NOTE

If you haven't downloaded the `index.html` file from Claude yet, do that first before continuing with this guide.

2

FREE · TAKES ~5 MINUTES

Create a GitHub account & repository

GitHub stores your website files. Cloudflare will pull from it automatically.

1

Go to GitHub

Open Safari or Chrome and navigate to github.com

2

Sign up for a free account

Click

Sign up

in the top right. Use any email you want — your personal Gmail is fine. Choose a username (something simple like *chrisgantf* or *cgantf*). Select the

Free

plan when asked.

3

Create a new repository

Once logged in, click the green

New

button (top left, next to "Repositories"). Name it

chrisgantf-site

. Leave everything else at defaults. Make sure

Public

is selected. Click

Create repository

.

4

Upload your index.html file

On the new repository page, click

uploading an existing file

(it's a link in the middle of the page). Drag your

index.html

file into the upload box, or click to browse to it. Scroll down and click

Commit changes

(green button). Leave the default message as-is.

✓ DONE WHEN YOU SEE

Your repository page now shows

index.html

listed as a file. That means your site is uploaded and ready.

3

FREE · TAKES ~5 MINUTES

Set up Cloudflare Pages

This is where your site actually gets hosted and made live on the internet.

1

Log into your Cloudflare account

Go to dash.cloudflare.com and sign in with the account you used to buy chrisgantt.com.

2

Navigate to Pages

In the left sidebar, click

Workers & Pages

. Then click the

Pages

tab at the top. Click

Create a project

.

3

Connect to GitHub

Click

Connect to Git

. You'll be asked to authorize Cloudflare to access your GitHub — click

Authorize Cloudflare Pages

. Then select your

chrisgantt-site

repository and click

Begin setup

.

4

Configure the deployment settings

On the setup screen, you don't need to change anything. The defaults work perfectly for a simple HTML site. Scroll down and click

Save and Deploy

.

✓ DONE WHEN YOU SEE

A success screen with a temporary URL like `chrisgantt-site.pages.dev` —

click it to confirm your site loads in the browser. It should look exactly like what Claude built.

4

TAKES ~5 MINUTES + UP TO 24HR DNS PROPAGATION

Connect chrisgantt.com to your site

This points your real domain to the site Cloudflare is now hosting.

1

Open your Pages project settings

In Cloudflare, go back to

Workers & Pages

, click on your

chrisgantt-site

project, then click the

Custom domains

tab.

2

Add your root domain

Click

Set up a custom domain

. Type in: chrisgantt.com (no www). Click

Continue

. Since you bought the domain through Cloudflare, it will automatically detect it and configure the DNS record for you. Click

Activate domain

.

3

Wait for it to go active

The domain status will show

Initializing

for a few minutes, then switch to

Active

. Once it says Active, go to chrisgantt.com in your browser — your site should load.

INFO

DNS changes can take anywhere from a few minutes to 24 hours to fully propagate worldwide. If it doesn't load immediately, wait 15 minutes and try again. This is completely normal.

5

TAKES ~2 MINUTES

Add www.chrisgantt.com

So anyone who types www. in front of your address gets to your site too.

1

Still in Custom Domains — add a second domain

Click

Set up a custom domain

again. This time type: `www.chrisgantt.com` (with the www). Click

Continue

.

2

Cloudflare handles the redirect automatically

Cloudflare will recognize that

`chrisgantt.com`

is already connected and will automatically set up

`www.chrisgantt.com`

to redirect to it. Click

Activate domain

.

✓ DONE WHEN YOU SEE

Both

`chrisgantt.com`

and

`www.chrisgantt.com`

listed under Custom Domains, both showing

Active

status. Test both in your browser — they should both load your site.

6

OPTIONAL BUT HIGHLY RECOMMENDED · TAKES ~5 MINUTES

Set up `chris@chrisgantt.com` email

Get a professional email address that forwards to your regular inbox — completely free.

1

Go to Email Routing in Cloudflare

In the left sidebar, click on

chrisgantt.com

under your domains. Then in the left menu click

Email

→

Email Routing

.

2

Enable Email Routing

Click

Enable Email Routing

. Cloudflare will automatically add the required DNS records. Click

Add records and enable

to confirm.

3

Create a routing rule

Under

Routing Rules

, click

Create address

. In the *Custom address* field type

chris

(this creates `chris@chrisgantt.com`). In the *Destination address* field enter your personal email (Gmail, etc). Click

Save

4

Verify your destination email

Cloudflare will send a verification email to your personal inbox. Open it and click the verification link. Once verified, any email sent to

chris@chrisgantt.com

will automatically forward to your personal inbox.

✓ TEST IT

Send a test email to

chris@chrisgantt.com

from any email address. Within a minute or two it should appear in your regular inbox.

When you're done, you'll have:

- ✦ **chrisgantt.com live**
Your personal/professional site deployed and accessible to anyone in the world.
- ✦ **www. redirect working**
Both versions of your URL lead to your site — no confusion, no errors.
- ✦ **chris@chrisgantt.com**
A professional email address forwarding to your regular inbox for free.
- ✦ **Auto-deploys set up**
Any future updates you make to your GitHub file will go live automatically.

QUICK REFERENCE CHECKLIST

- ☐ index.html downloaded and saved on MacBook
- ☐ GitHub account created at github.com
- ☐ New repository created (chrisgantt-site)
- ☐ index.html uploaded to GitHub repository
- ☐ Cloudflare Pages project created and connected to GitHub
- ☐ Site confirmed live at .pages.dev temporary URL
- ☐ chrisgantt.com added as custom domain — status: Active
- ☐ www.chrisgantt.com added as custom domain — status: Active
- ☐ Both URLs tested in browser ✓
- ☐ Email Routing enabled in Cloudflare
- ☐ chris@chrisgantt.com → forwarding to personal email
- ☐ Test email sent and received ✓
